WEATHER SYNOPSIS BY REGION

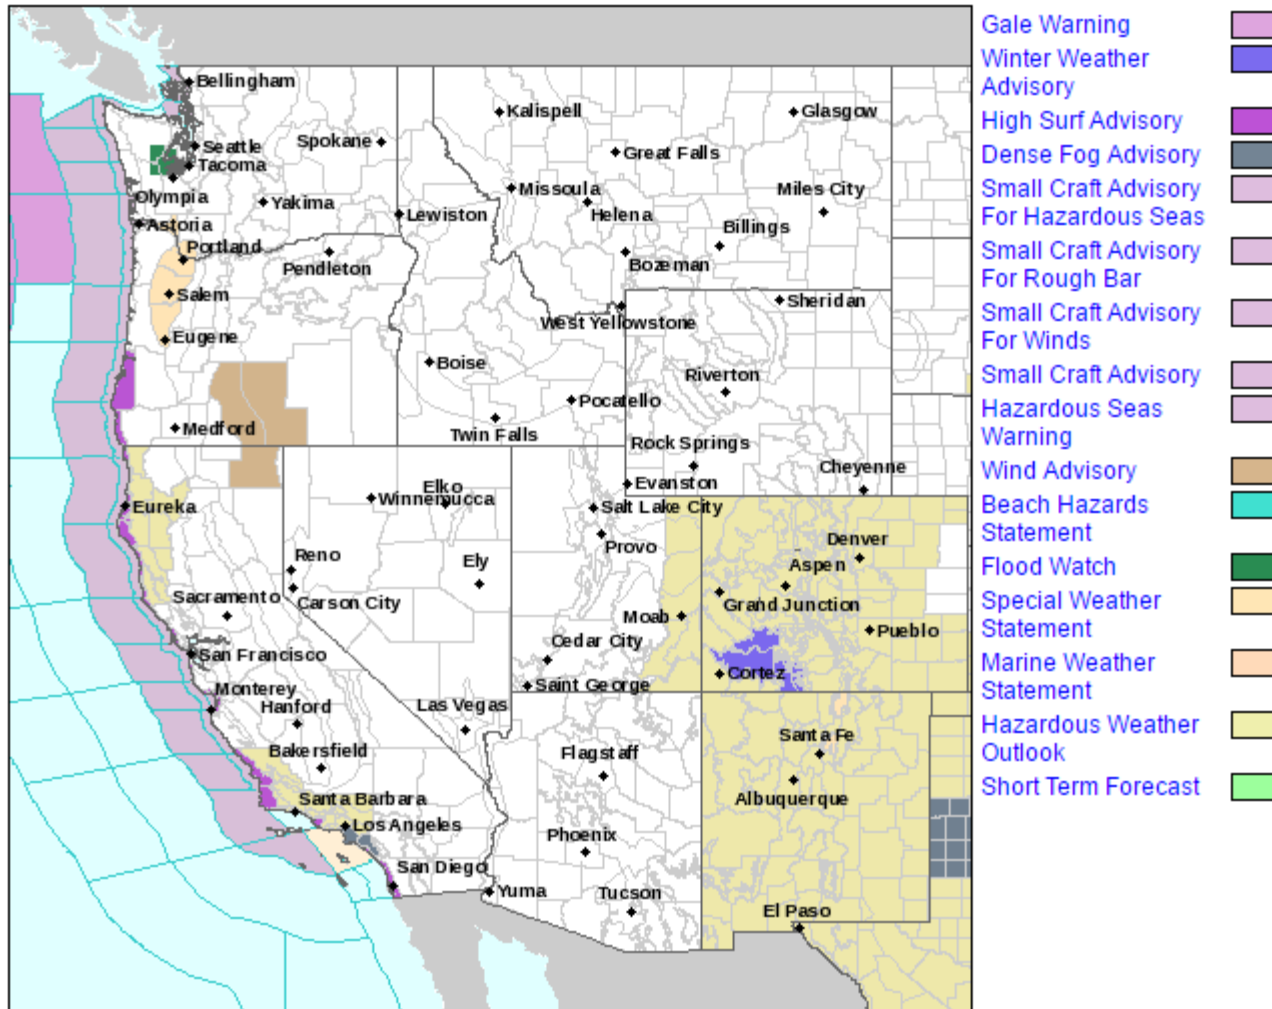

NORTHERN CALIFORNIA

The region will be in between a high pressure ridge to the east and a frontal system offshore through midday today. High clouds and southerly winds will increase today as the frontal system approaches the coast. The system will move onshore with moderate to briefly heavy rain this afternoon, and spread to the remainder of the region late today through early Sunday. The system will weaken rapidly as it moves farther inland. A few scattered showers will continue Sunday into early Monday, but the general trend will be toward warmer, drier, and sunnier weather. Northwest California may see 1-2 inches of rainfall out of this event while the remainder of the region receives much lighter amounts. Some spots in the far east and south may only see a trace from this system. Snow levels will be around 5500 feet near the Oregon state line and 7000 feet closer to Lake Tahoe. Another weak system will produce rain in far northwest California late Tuesday. Following another short break between systems Wednesday, a more widespread, sustained period of light precipitation appears to be possible the end of next week.

SOUTHERN CALIFORNIA

A ridge of high pressure centered over California will cause temperatures to be 5 to 10 degrees above normal today, with mid 60s to mid 70s across the mountains and mid 70s to mid 80s in the valleys. The ridge will weaken as a trough moves inland across the Pacific Northwest causing temperatures to cool around 5 degrees Sunday. Temperatures will warm back to 5 to 10 degrees above normal Monday through the end of next week as the ridge of high pressure strengthens once again. Minimum humidity will be mainly between 15% and 30% through the end of next week. Winds will be light across the region through the end of next week.
